915. Partition Array into Disjoint Intervals

Medium Topics Companies

Given an integer array `nums`, partition it into two (contiguous) subarrays `left` and `right` so that:

- Every element in `left` is less than or equal to every element in `right`.
- `left` and `right` are non-empty.
- `left` has the smallest possible size.

Return the *length* of `left` *after such a partitioning*.

Test cases are generated such that partitioning exists.

Example 1:

```
Input: nums = [5,0,3,8,6]
Output: 3
Explanation: left = [5,0,3], right = [8,6]
```
